

SF Private Bank — Outstanding API Requests

Lux Industries, Inc. · one-page summary of the full audit (*Platform API Audit: Received Surface and Required APIs*, 2026)

Received to date. Three integration guides: *Account Management* (card account for natural persons, KYC status), *Virtual Cards* (KYC/consent lifecycle, hosted URLs), and *Crypto Service* (custodial wallets, sends, swaps — production host `crypto-v1-api-rdqehkur6a-ey.a.run.app`, production-only). No other base URL, no authentication scheme, no API Reference, and no credentials have been issued.

Still needed, in order:

1. **Access.** Sandbox *and* production base URLs for every service; the full API Reference the guides cite; the authentication scheme; sandbox credentials.
2. **Onboarding.** User provisioning (`POST /user` — the user both card guides presuppose) and server-to-server identity document submission (identity document, proof of address, liveness; KYB for entities), with KYC decision webhooks.
3. **Accounts.** Ewallet and IBAN account opening for individuals *and corporates* — the received `POST /account/:userId` accepts natural-person fields only — returning account details (IBAN/BIC), with balances and transaction history.
4. **Payments.** Beneficiary registration; domestic ACH and SWIFT/Fedwire origination with status lifecycle and settlement webhooks; P2P and ewallet ↔ bank transfers.
5. **Cards.** The single-card order endpoint the Virtual Cards guide references (path unspecified); physical card orders (plastic, metal); activation; load; lock/unlock; real-time authorization and transaction webhooks.
6. **Webhooks.** The delivery contract — signed payloads, the complete event catalog, replay by event id. Reconciliation and fee reports to follow.
7. **Crypto.** The Crypto Service authentication scheme and a testnet-backed sandbox (the service errors outside production today).

With items 1–3, accounts open — individual and corporate. With 4, money moves. With 5–7, the complete program operates at production quality. *Not requested:* FX and crypto conversion — we execute both ourselves and settle plain fiat over the standard rails. Where a shorthand helps, the Wise Platform API is the reference shape for each item.
