Where to Start

Ten ways to work together, cheapest first. Lift is our estimate of engineering work; return is the effect on MOR's usage, liquidity, or credibility; the move names whose signature it needs. The first three need no Morpheus vote.

Hanzo lists as a provider on Base. days · a config entry · ours

Our inference earns MOR from the first session; the marketplace is permissionless to join. Nothing on Base changes.

Feature and list MOR on LX. days · one-file featured tier + an order-book pair · ours

A two-sided book replaces the roughly \$600k of one-sided reserve, and a \$100k order stops being eleven days of the whole market. MOR gets price discovery from a real book.

Bridge MOR natively, and open LMOR credit. low · MOR is already an OFT · ours, given the address

Our bridge already spans MOR's chains, so listing it is asset registration plus a wrapper; a Morpho market is one transaction. Holders borrow against MOR without a forced sale.

Put a fee on verified volume into the buyback. a small contract change · high return · Morpheus

Revenue then scales with usage instead of deposits, and the roughly ten-to-one gap between emission and real revenue begins to close. This is the single highest-return change on the list.

Make the Base meter read what the receipt already signs. weeks · no migration · Morpheus

Decode the two token-count words the signed receipt already carries, and require the consumer to be a different party than the provider. Settlement stops being fakeable, which is what makes the fee above honest.

Route agents through Enso and Hanzo. medium · joint

Morpheus ships agent templates but no decentralized runtime behind them; our learned router and attested providers are that backend, and our own demand becomes MOR volume.

Encrypt the prompt in transit. medium · Morpheus to adopt

Consumer prompts cross the provider port in cleartext today. Our hybrid post-quantum session layer drops in and closes a confidentiality gap the community already raised.

Attest inference on the A-Chain. medium-high · joint

The node's TEE work becomes a consensus-checkable attestation rather than an off-chain check — evidence that a specific model ran on specific silicon, not a promise.

Adopt mord as the settlement VM. a VM · joint, gated on volume

The structural end of fakeable receipts: capacity, work, and identity priced as three quantities rather than one, benchmarked at about 3,400 verified sessions per second per core.

Onboard as a sovereign Lux L2. largest · Morpheus governance

Inherit Quasar's classical-fast, post-quantum-durable finality and a validator set instead of building consensus. MOR stays thin on top; the chain, the DAO, and the finality are rented, not rebuilt.

It is a ladder, not a bundle. Each rung stands on the one below, but each also returns on its own, and you can stop at any height. Start at the top: the first three cost us about a week and ask nothing of your governance.

ADOPT-00. Full argument and provenance in the omnibus ([morpheus-omnibus.pdf](#)); each move expands to its own ADOPT brief. • research@lux.network
